Prompt:
According to the most recent NTSB statistics, there were six million automobile crashes in the US in 2015. The impact means hundreds of billions of dollars in economic costs that resulted in 1.5 million injuries, and 35,000 deaths. The overwhelming cause of these crashes were drivers.

Absent autonomous driving vehicles as a solution, research causation and engineer a solution to reduce driver induced accidents. Be specific in the area to be addressed and the expected outcomes from your solution based upon data.
